PART ONE

# Background

---

# Capacity test

Does the new plant operate as expected?

**Capacity test**

$$\begin{array}{ccc} \uparrow & & \uparrow \\ \text{Measured} & = & \text{Modelled} \\ \text{power} & & \text{power} \end{array}$$

# Capacity test

## ASTM E2848

$$P = E_{POA} \times (a + b \times E_{POA} + c \times T_{amb} + d \times WS)$$

### E.g.

$E_{POA} = 850 \text{ W/m}^2$   
 $T_{amb} = 25 \text{ }^\circ\text{C}$   
 $WS = 2.5 \text{ m/s}$

## MCTC

$$P_{corr} = a + b \cdot E_{POA}$$

### E.g.

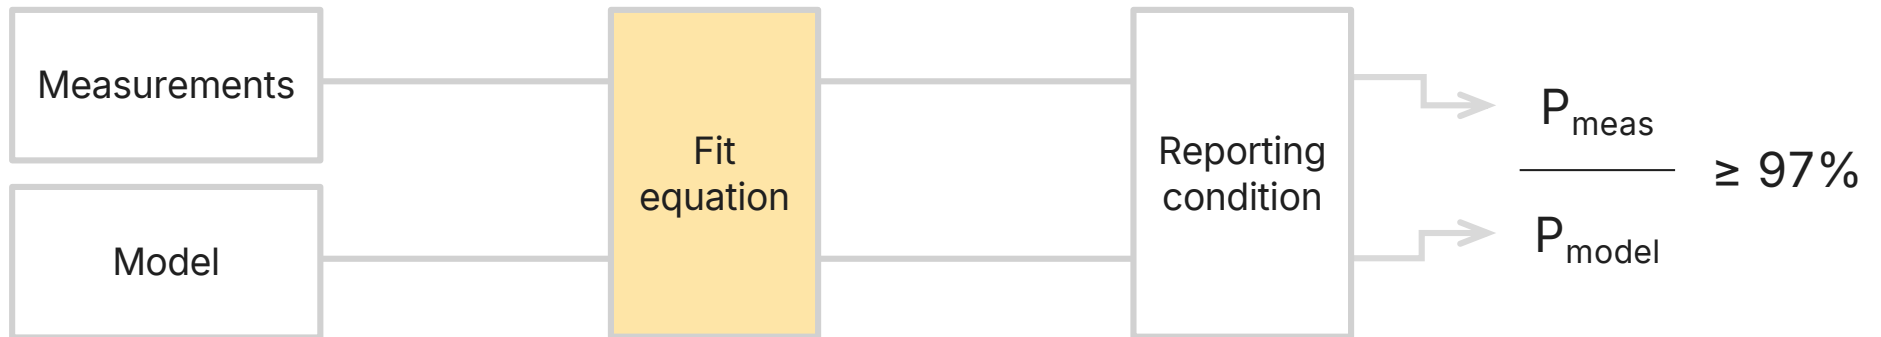

$E_{POA} = 850 \text{ W/m}^2$   
 $T_m = 40 \text{ }^\circ\text{C}$

**Or**  
 95%  
 96%  
 98%

# Example test — ASTM

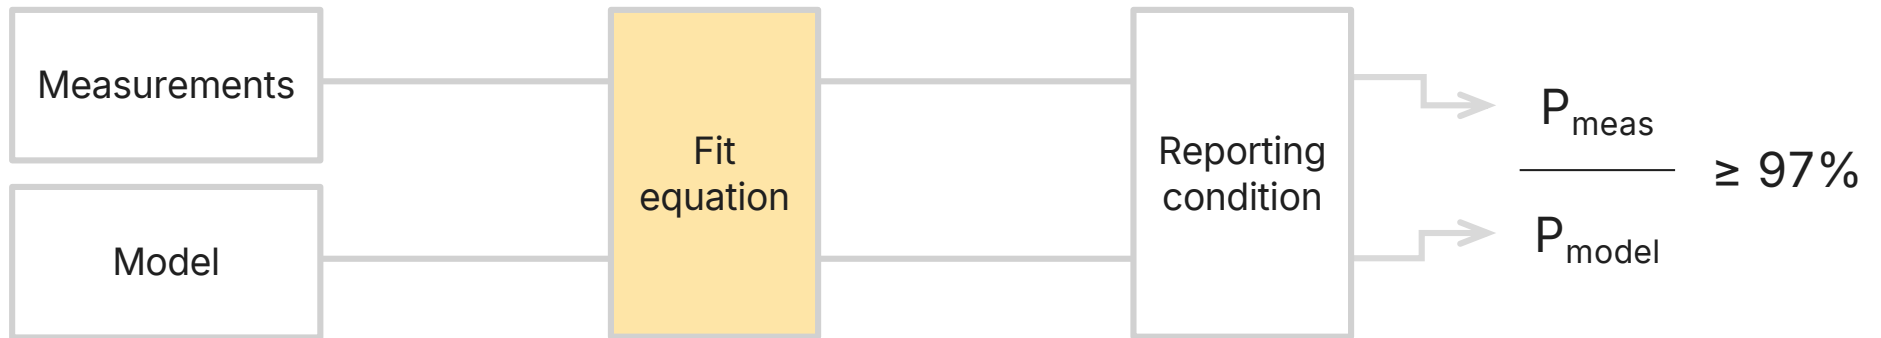

# Example test — ASTM

$$P = E_{POA} \times (a + b \times E_{POA} + c \times T_{amb} + d \times WS)$$

# Example test — ASTM

$$P / E_{POA} = a + b \times E_{POA} + c \times T_{amb} + d \times WS$$

# Example test — ASTM

$$P / E_{POA} = 1.1e-1 + -4.8e-6 \times E_{POA} + 2.6e-5 \times T_{amb} + 1.4e-4 \times WS \quad R^2 = 0.987$$

# Example test — ASTM

$$P / 850 = 1.1e-1 + -4.8e-6 \times 850 + 2.6e-5 \times 25 + 1.4e-4 \times 2.5$$

$$P_{\text{meas}} = 93.3 \text{ MW}$$

# Example test – MCTC

$T_m = 40\text{ }^\circ\text{C}$

# Example test – MCTC

$$P_{\text{corr}} = a + b \times E_{\text{POA}}$$

$$T_m = 40 \text{ }^\circ\text{C}$$

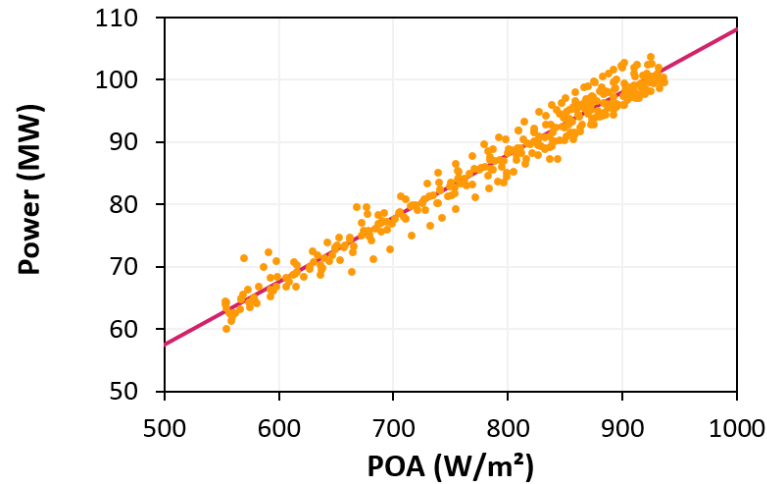

# Example test – MCTC

$$P_{corr} = 6.84 + 0.101 \times E_{POA}$$

$$R^2 = 0.968$$

$T_m = 40 \text{ }^\circ\text{C}$

# Example test – MCTC

$$P_{corr} = 6.84 + 0.101 \times 850$$

$$P_{meas} = 93.0 \text{ MW}$$

# Capacity test

E.g., if model matches measurements:

$$\frac{P_{\text{meas}} = 100 \text{ MW}}{P_{\text{model}} = 100 \text{ MW}} = 100\% \geq 97\% \quad \text{PASS}$$

# Capacity test

What if

- POA meas 1% high

$$\frac{P_{\text{meas}} = 99 \text{ MW}}{P_{\text{model}} = 100 \text{ MW}} = 99\% \geq 97\% \quad \text{PASS}$$

# Capacity test

What if

- POA meas 1% high
- P meas 1% low

$$\frac{P_{\text{meas}} = 98 \text{ MW}}{P_{\text{model}} = 100 \text{ MW}} = 98\% \geq 97\% \quad \text{PASS}$$

# Capacity test

What if

- POA meas 1% high
  - P meas 1% low
  - T model 3 °C low
- $$\frac{P_{\text{meas}} = 98 \text{ MW}}{P_{\text{model}} = 101 \text{ MW}} = 97\% \geq 97\% \quad \text{PASS}$$

# Capacity test

What if

- POA meas 1% high
  - P meas 1% low
  - T model 3 °C low
  - Spectral model 1% high
- $$\frac{P_{\text{meas}} = 98 \text{ MW}}{P_{\text{model}} = 102 \text{ MW}} = 96\% < 97\% \quad \text{FAIL}$$

PART TWO

# Case study

---

# Site details

- Site
  - Midwest
  - > 100 MW
  - Single-axis tracker
  - True tracking (no back tracking)
  - First Solar modules (CdTe)
  - Monofacial
- Capacity test
  - 25-day monitoring period
  - ASTM and MCTC

# Site conditions — weather

POA: 0–1130 W/m<sup>2</sup>

T<sub>amb</sub>: 6–33 °C

WS: 0.2–5.6 m/s

# Site conditions — weather

## ■ Filtering

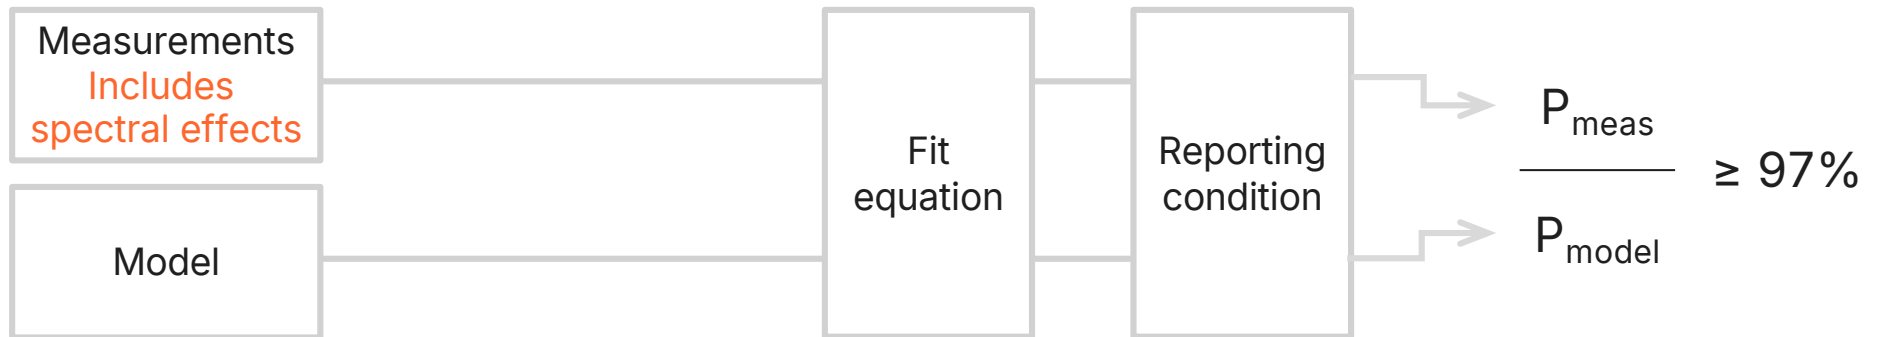

- Clipping, curtailment
  - Spatially varying GHI
  - Direct shading
  - $POA > 950 \text{ W/m}^2$
  - $POA < 550 \text{ W/m}^2$
- 355 data points  
(5-min steps)

POA: 550–940  $\text{W/m}^2$

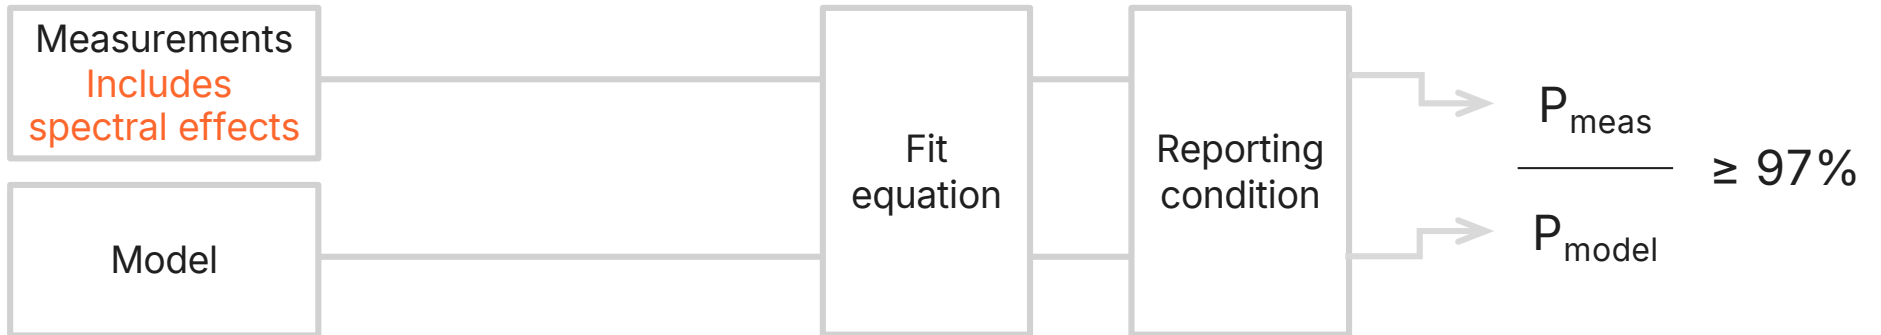

$T_{\text{amb}}$ : 13–33 °C

WS: 0.4–5.1 m/s

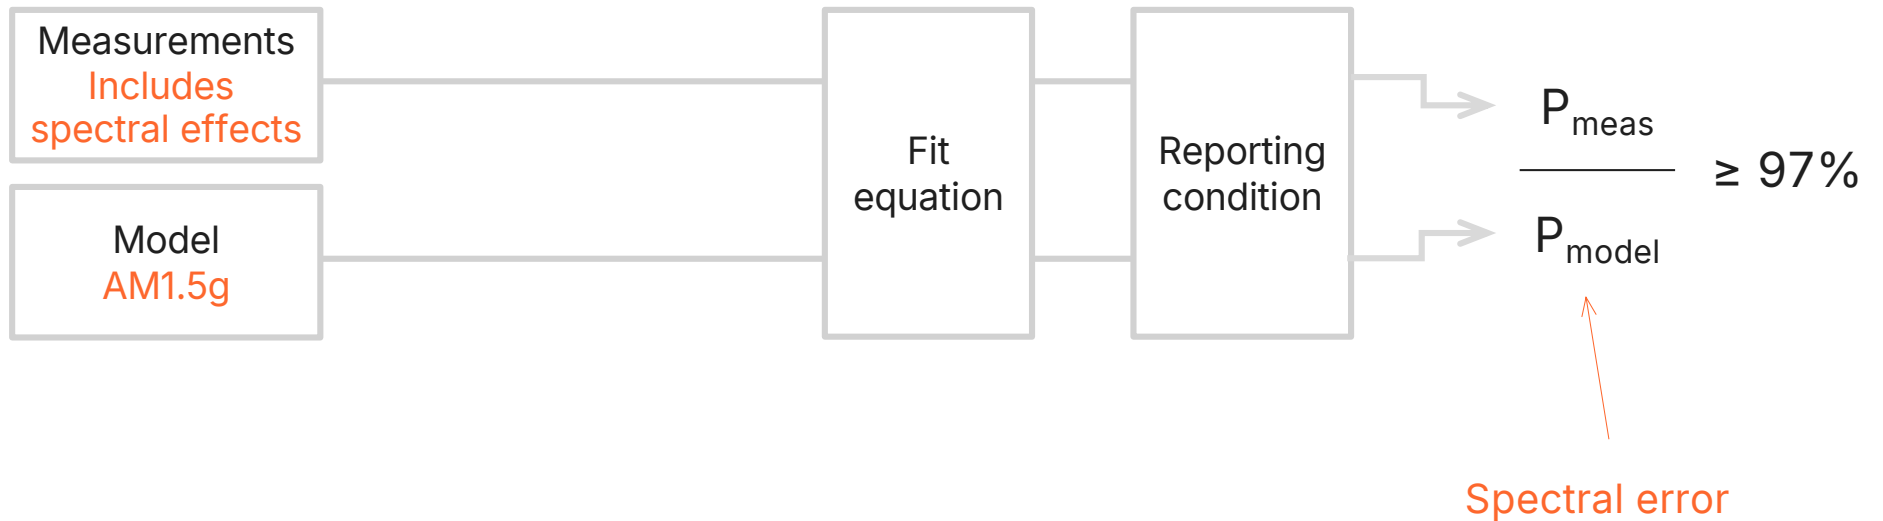

# Capacity test

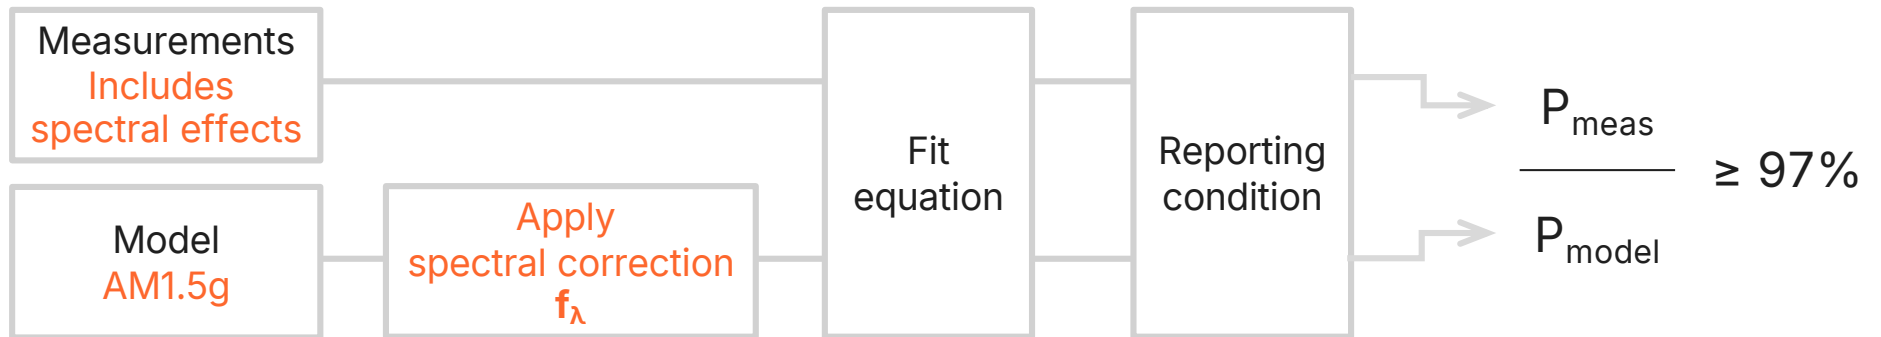

# Capacity test

# Capacity test

# Correction with First Solar model

- E.g., PVsyst, Plant Predict, Solar Farmer, Duet, etc.

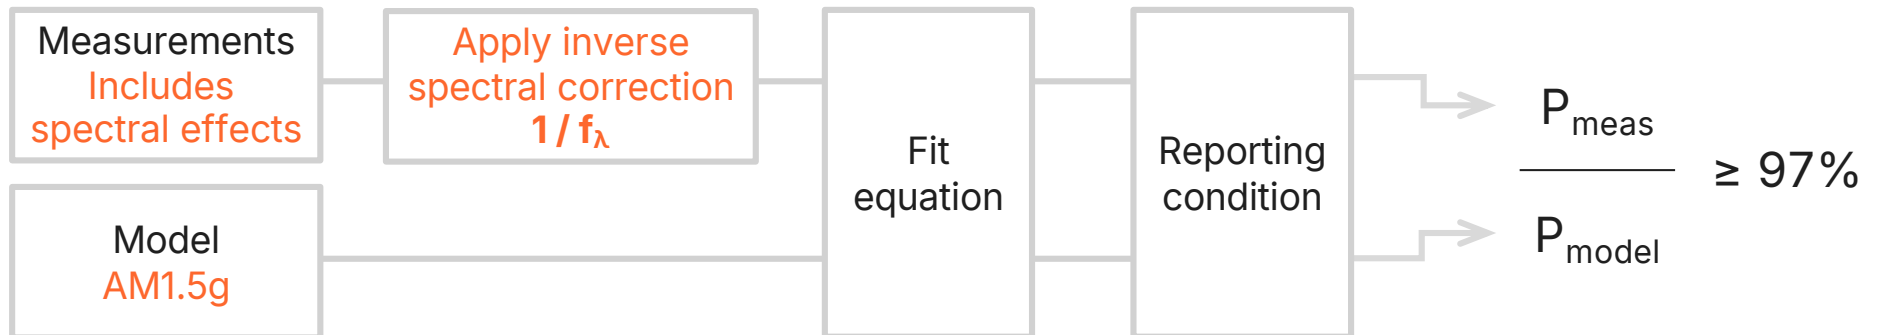

- Solve optics at AM1.5g.

- Correct with First Solar model.

$$f_{\lambda} = c_1 + c_2 AM_a + c_3 P_w + c_4 \sqrt{AM_a} + c_5 \sqrt{P_w} + c_6 \frac{AM_a}{\sqrt{P_w}}$$

Airmass
PWV

# Correction with First Solar model

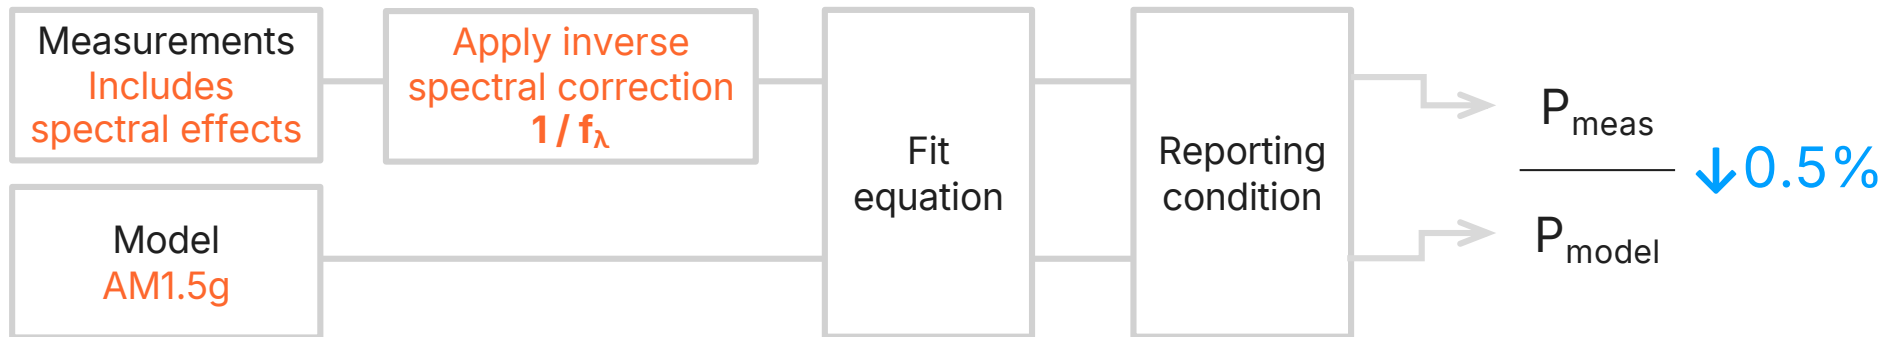

- E.g., PVsyst, Plant Predict, Solar Farmer

- Solve optics at AM1.5g.

- Correct with First Solar model.  $f_\lambda = c_1 + c_2 AM_a + c_3 P_w + c_4 \sqrt{AM_a} + c_5 \sqrt{P_w} + c_6 \frac{AM_a}{\sqrt{P_w}}$

# Correction with First Solar model

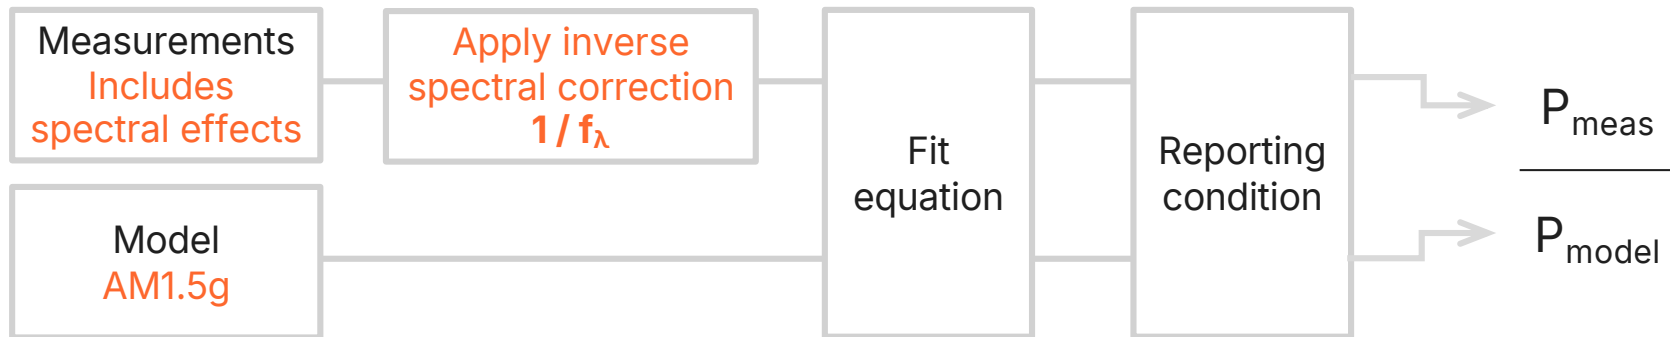

$R^2 = 0.980$

$P_{meas} = 92.1 \text{ MW}$

# Correction with reference modules

**Thermopile**

- QE ~ 100% all  $\lambda$

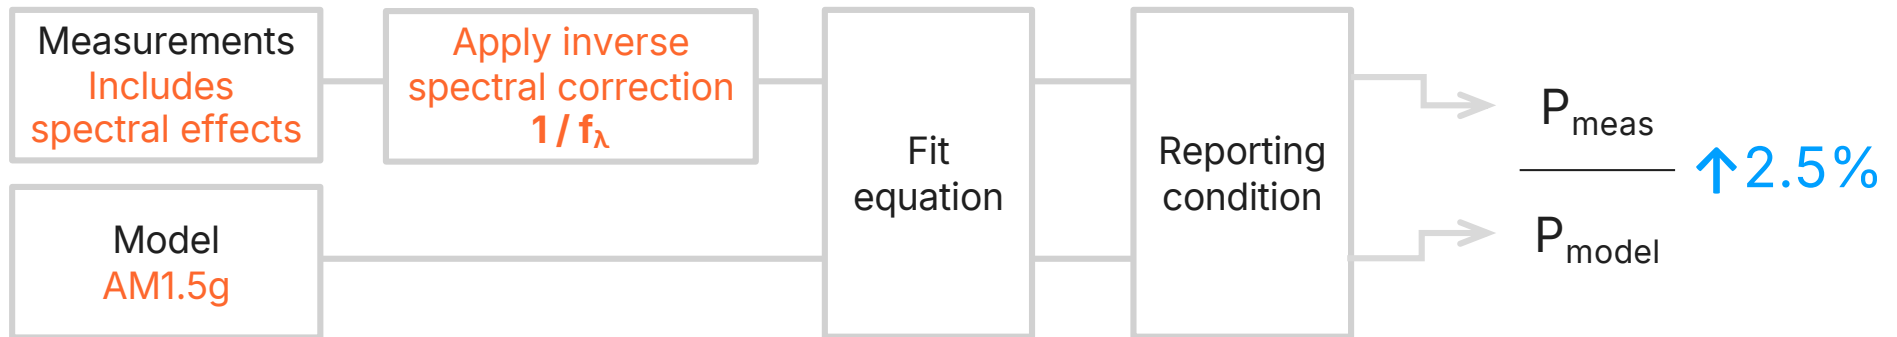

**Reference modules**

- $I_{sc}$  calibrated at AM1.5g
- T and IAM corrected
- Cleaned every day

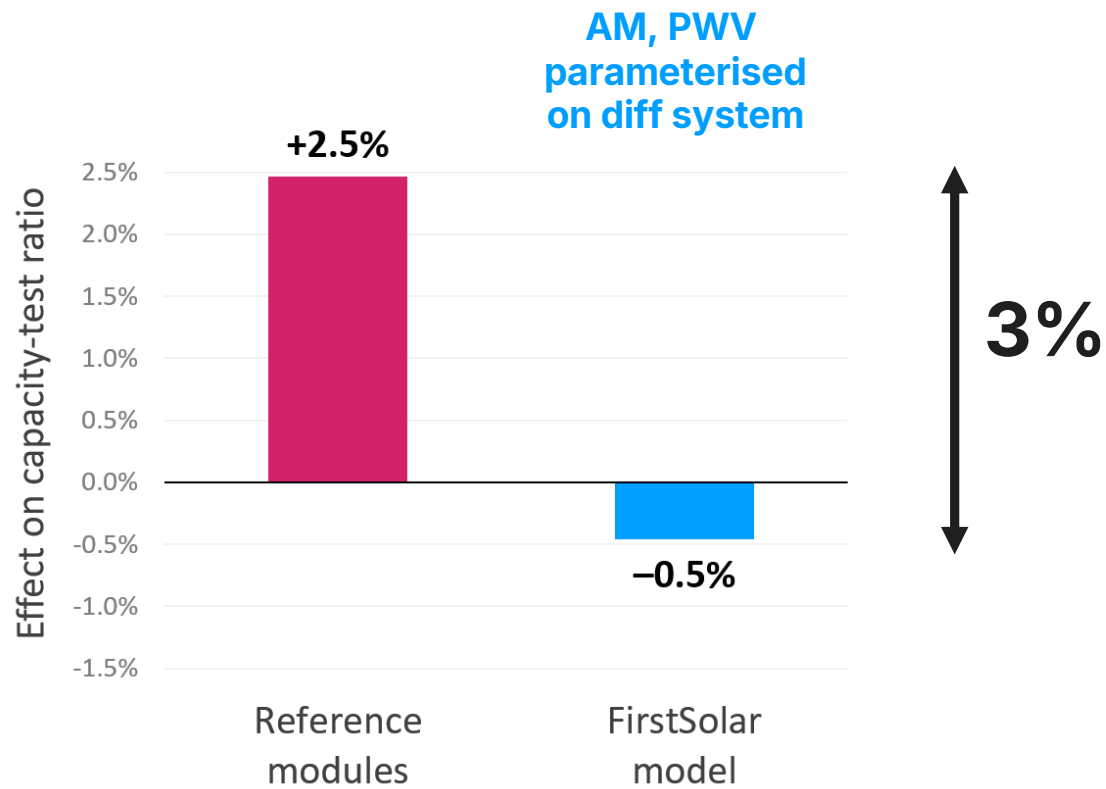

$$\frac{E_{POA}}{E_{POA \text{ AM1.5g}}} = f_{\lambda}$$

# Correction with reference modules

# Spectral impact

— CdTe

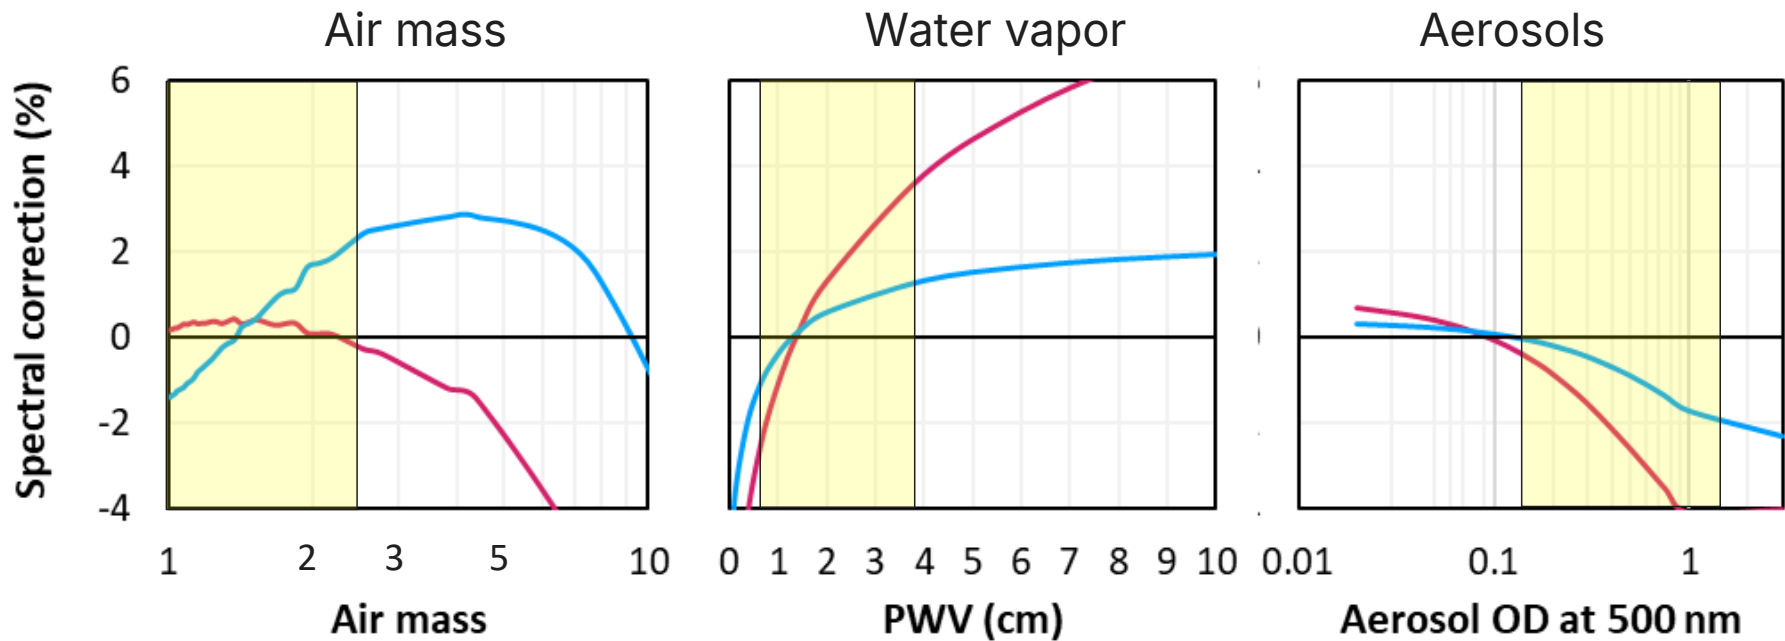

Calculations for clear skies:

- SMARTS 2.95
- Atmospheric values equal to AM1.5g defaults except swept value.
- QE of CdTe and C-Si in tutorial
- IAM = 1, no ground reflection
- Monofacial
- SAT, no BT, max tilt 60°
- Latitude ~40°
- Includes diffuse shading from neighbouring row

# Spectral impact

— CdTe  
— Silicon

Calculations for clear skies:

- SMARTS 2.95
- Atmospheric values equal to AM1.5g defaults except swept value.
- QE of CdTe and C-Si in appendix
- IAM = 1, no ground reflection

- Monofacial
- SAT, no BT, max tilt 60°
- Latitude 38°
- Diffuse shading from neighbouring row

PART FOUR

# Results

---

# Impact on capacity test — ASTM

# Impact on capacity test — ASTM

# Impact on capacity test — ASTM

# Impact on capacity test — ASTM

# Impact on capacity test — MCTC

# Impact on capacity test — ASTM — Si

# Conclusion

- Modelling errors  $> 1\%$  are of great concern to capacity tests.
  - Spectral effects can easily introduce errors of  $> 1\%$ .
  - Case study on monofacial CdTe system:
    - Different approaches to spectral correction  $\rightarrow$  vary over 3%.
    - FS model reduced capacity test ratio (neglected aerosols; diff config).
    - SunSolve, which applies more sophisticated spectral and optical models, gave trends closest to the reference module.
- $\rightarrow$  Tutorial on spectral correction — Thu 4:30 pm.
