Company Overview

- **Software Development of Design, Simulation and Modeling tools for Photovoltaic and Solar Heating Systems**
- **Established 1988**
- **40 employees (of which over 50% are engineers and developers)**

Global Headquarters:

Dr. Valentin EnergieSoftware GmbH

Berlin, Germany

www.valentin.de

North American Headquarters:

Valentin Software, Inc.

Temecula, CA

www.valentin-software.com

info@valentin-software.com

Standard Software Families

PV*SOL basic

PV*SOL Pro

PV*SOL Expert

A dynamic simulation program for the **design and calculation of photovoltaic systems**, including grid-connected, off-grid and battery backed-up systems.

T*SOL basic

T*SOL Pro

T*SOL Expert

A dynamic simulation program for the **design and optimization of solar thermal systems**, for applications including space heating, domestic hot water, pools and industrial usage.

```

PV*SOL Expert

PV*SOL Expert

3D Visualization plus all the capabilities and features of PV*SOL Pro

- Shading animation or situation for given date and time
- For each module its own horizon and sun course

```
/// <summary>
/// Fill the variables
/// </summary>
/// <returns></returns>
public string PreviewPrint()
{
    ReadXML();
    IsPreviewNotRTF = true;
    String sz = GetLLFile();
    Print();
}

set { m_DesignTemplate = value; }
get { return m_DesignTemplate; }

/// <summary>
/// Sets the language for the Preview Editor (Toolbar)

/// </summary>
public String Language { set; get; }

public IntPtr Handle { set; get; }

/// <summary>

```

Calculation of PV Array

Shading analysis helps defining the strings.

Each MPP tracker defines an array.

At each time step the following steps are done :

- Calculation of IV-Curves depending on irradiation, temperature and shadow situation
 - For each module
 - For each string
 - For the array
- Determination of the point of maximal power in the I-V-Curves of the array

Reduction of radiation for each module (direct & diffused)

2 MPP tracker with 2 strings each

```

/// <summary>
/// Fill the variables
/// </summary>
/// <returns></returns>
public string PreviewPrint()
{
    ReadXML();
    IsPreviewNotRTF = true;
    String sz = GetLLFile();
    Print();
}

set { m_DesignTemplate = value; }
get { return m_DesignTemplate; }

/// <summary>
/// Sets the language for the Preview Editor (Toolbar)
/// </summary>
public String Language { set; get; }

public IntPtr Handle { set; get; }

/// <summary>

```

Module Substrings

- Bypass diodes split the module to serial substrings. The count of diodes defines the count of substrings.
- A substring is regarded as fully shaded if the shade line cuts the substring area.
- Shaded cells get the diffuse radiation only.
- Substrings can get parameterized as horizontal or vertical. Important in case of inter row shading.
- Example:
I-V-Curve
of half shaded module

```

/// <summary>
/// Fill the variables
/// </summary>
/// <returns></returns>
public string PreviewPrint()
{
    ReadXML();
    IsPreviewNotRTF = true;
    String sz = GetLLFile();
    Print();
}

set { m_DesignTemplate = value; }
get { return m_DesignTemplate; }

/// <summary>
/// Sets the language for the Preview Editor (Toolbar)
/// </summary>
public String Language { set; get; }

public IntPtr Handle { set; get; }

/// <summary>

```

Thin Film Modules

Source: First Solar Documentation
PD_5_425_Module_Characterization_Module_Shading.pdf

- Partial shading of all stripes reduces linearly.
- Shading of complete stripes reduces disproportionately.
- PV-modules based on thin film cell stripes were calculated as shown in the diagram!

First Solar Module Characterization

PD-5-425
Revision Level: A

SHADED ALONG
1200mm DIMENSION

SHADED ALONG
600mm DIMENSION

```

/// <summary>
/// Fill the variables
/// </summary>
/// <returns></returns>
public string PreviewPrint()
{
    ReadXML();
    IsPreviewNotRTF = true;
    String sz = GetLLFile();
    Print();
}

set { m_DesignTemplate = value; }

        IsPreviewNotRTF = true;
        String sz = GetLLFile();
        Print();
    }

    set { m_DesignTemplate = value; }
    get { return m_DesignTemplate; }
}

/// <summary>
/// Sets the language for the Preview Editor (Toolbar)
/// </summary>
    public String Language { set; get; }

    public IntPtr Handle { set; get; }

/// <summary>

```

Model Requirements

- Valid on MPP and for arbitrary voltage values (I-V Curves)
- Based on data sheet (working points at STC)
- Fast calculation algorithms
 - So far the One-Diode-Model succeeds.
- + Tunable „Low Radiation Efficiency“
- => Valentin's Model Extension:

Extra Working Points at an arbitrary radiation

```

/// <summary>
/// Fill the variables
/// </summary>
/// <returns></returns>
public string PreviewPrint()
{
    ReadXML();
    IsPreviewNotRTF = true;
    String sz = GetLLFile();
    Print();
}

set { m_DesignTemplate = value; }
get { return m_DesignTemplate; }

/// <summary>
/// Sets the language for the Preview Editor (Toolbar)
/// </summary>
public String Language { set; get; }

public IntPtr Handle { set; get; }

/// <summary>

```

Efficiency Dependency on Radiation

- Needed data: $G_{\text{low rad}}$, U_{OC} , U_{MPP} , I_{MPP} , I_{SC}
- This defines: Fill factor at $G_{\text{low rad}}$
- Approach for fill factor dependency:

$$\text{FF}(G) = G / (a \cdot G^2 + b \cdot G + c)$$
- Resulting efficiency dependency at Maximum Power Points
- Values in database defined by manufacturers
- For user defined modules PV*SOL proposes default values depending on cell type.

```

/// <summary>
/// Fill the variables
/// </summary>
/// <returns></returns>
public string PreviewPrint()
{
    ReadXML();
    IsPreviewNotRTF = true;
    String sz = GetLLFile();
    Print();
}

set { m_DesignTemplate = value; }
get { return m_DesignTemplate; }

/// <summary>
/// Sets the language for the Preview Editor (Toolbar)
/// </summary>
public String Language { set; get; }

public IntPtr Handle { set; get; }

/// <summary>

```

Construction of I-V-Curves

- **STC-** and $G_{\text{low rad}}$ – Points
- I_{SC} as linear and U_{OC} as logarithmic function of radiation
- MPPs by fill factor dependency
- To the left and right of the MPP the parameters of the 1-diode-model are fitted:

$$I = I_{\text{ph}} - I_{\text{sat}} * (e^{U/U_T} - 1) - U / R_{\text{sh}}$$

```

/// <summary>
/// Fill the variables
/// </summary>
/// <returns></returns>
public string PreviewPrint()
{
    ReadXML();
    IsPreviewNotRTF = true;
    String sz = GetLLFile();
    Print();
}

set { m_DesignTemplate = value; }
get { return m_DesignTemplate; }

/// <summary>
/// Sets the language for the Preview Editor (Toolbar)
/// </summary>
public String Language { set; get; }

public IntPtr Handle { set; get; }

/// <summary>

```

Dependency on Module Temperature

- Calculated by temperature change coefficients for I_{SC} , U_{OC} and P_{MPP}

```
/// <summary>
/// Fill the variables
/// </summary>
/// <returns></returns>
public string PreviewPrint()
{
    ReadXML();
    IsPreviewNotRTF = true;
    String sz = GetLLFile();
    Print();
}

set { m_DesignTemplate = value; }
get { return m_DesignTemplate; }

/// <summary>
/// Sets the language for the Preview Editor (Toolbar)
/// </summary>
public String Language { set; get; }

public IntPtr Handle { set; get; }

/// <summary>
```

Current Work at Module Modelling

- We implemented 1-diode-model and 2-diode-model for those, who know the parameters and prefer these models.
- In general the Valentin model based on STC and **extra low radiation** working points fits better than diode models based on **STC-data only**. This was shown by Martin Hofmann in his master thesis, which is based on indoor and outdoor measurements.
(see also our presentation on **WREF (ASES)** last year in Denver:
https://ases.conference-services.net/resources/252/2859/pdf/SOLAR2012_0080_full%20paper.pdf)
- We plan to publish the detailed model description at the *PV Performance Modelling Collaborative* (pvpmc.org) .
- Easier parametrizing: Based on STC and efficiency at different radiation, PV*SOL calculates the demanded extra working points.

```
/// <summary>
/// Fill the variables
/// </summary>
/// <returns></returns>
public string PreviewPrint()
{
    ReadXML();
    IsPreviewNotRTF = true;
    String sz = GetLLFile();
    Print();
}

set { m_DesignTemplate = value; }
get { return m_DesignTemplate; }

}

/// <summary>
/// Sets the language for the Preview Editor (Toolbar)
/// </summary>
public String Language { set; get; }

public IntPtr Handle { set; get; }

/// <summary>
```

Summary

Shading calculation with PV*SOL Expert

- Detailed definition of shading objects
- Shading detected on cell level (substrings/stripes)
- Accurate model of PV module
- Explicit connection of modules and strings to construct the MPP (I-V-curves of array)
- Last but not least: The calculation is fast.

```
/// <summary>
/// Fill the variables
/// </summary>
/// <returns></returns>
public string PreviewPrint()
{
    ReadXML();
    IsPreviewNotRTF = true;
    String sz = GetLLFile();
    Print();
}

set { m_DesignTemplate = value; }
get { return m_DesignTemplate; }

/// <summary>
/// Sets the language for the Preview Editor (Toolbar)
/// </summary>
public String Language { set; get; }

public IntPtr Handle { set; get; }

/// <summary>
```
